

OVER **85%** OF PATIENTS & CRITICAL CARE NURSES WOULD SPECIFICALLY REQUEST THE **SUCTIONSHIELD**.

HAIs negatively impact satisfaction among patients and nurses

CRITICAL CARE NURSES*

Said they don't have a protocol to safely handle oral suction tips.

The most common places that nurses store oral suction tips are under the patient's pillow, back in the peel-pack, or hanging at the patient's bedside.

Feel confident the SuctionShield would protect both patients and caregivers from pathogens.

Only 49% currently have a protocol to handle oral suction tips; 98% would be satisfied if equipment designed to safely store oral suction tips were protocol.

Would request SuctionShield specifically to help reduce HAIs among their patients.

Over 65% know a patient who acquired an HAI while in their care; 15% of nurses also reported contracting an HAI themselves.

A disposable holster that attaches to virtually any horizontal surface to hold suction implements, helping to reduce cross contamination and HAIs.
